TESTING

AUDITORY STEADY STATE RESPONSE (ASSR)

Connect the electrode cable to the white connector.

Connect the transducer to the appropriate connector:

- Headphones or insert earphones: blue connector
- Probe: red connector
- Second probe for binaural testing: blue connector

Clean the patient’s skin and place the electrode pads. Connect the clips to the corresponding sites. Recommended montage is:

- White: high forehead
- Black: cheek
- Red: mastoid

For binaural testing, place red electrode on the nape.
If you are using an ear probe or insert earphones, select the appropriate ear tip size and place it on the probe tip. Insert the probe in the ear making sure that the ear tip fits tightly into the ear canal.

If you are using headphones, place them over the ears.

Select ASSR

Select the protocol you would like to use. To change the parameters, select one of the presets and then the tools button at the bottom of the page:

Half octave stimuli provide better frequency specificity but longer test time

Select frequencies to test

Select masking noise (monaural testing only)

Select start, minimum and maximum level for adaptive mode

40 Hz: awake and adult patients, low frequencies ≤2kHz
80 Hz: babies and higher frequencies
Auto: mixed rate, optimized for performance

Fixed: will test all selected levels
Adaptive: used for threshold search

CONFIGURABLE TEST PARAMETERS
Select the test ear by pressing either the Right or Left button, or Right + Left for binaural testing. Binaural testing is available when headphones, insert phones or two ear probes are connected.

Make sure the patient is sitting or lying down comfortably.

An impedance check will be performed prior to measurement. If impedance is below 6 k ohm, the start button will become available. You can configure the settings for the test to autostart if the impedance is lower than 4 k ohm. If impedance is higher than 6 k ohm but below 12 k ohm, a skip button will become available. An impedance below 6 k ohm is recommended for best test results.
If you are using an ear probe, a calibration will be performed together with the impedance check. You can select the simple calibration or the expert calibration mode in the device set up.
