

Email from Dr. Aysen Erdil on February 18th, 2012

„In January we as Symbiosis-HNV (NGO) and volunteers from Sirnak Government Hospital have been to Sirnak-Uludere. We visited Ortakoy and Andac villages located on the border with North Iraq. 519 primary school students were examined by our doctors.

167 children were tested for their hearing with Santiero. All preschool + 1st and 2 grade children and older ones whenever suspected.

We used OAE and MAGIC and Pure –Tone audiometry.

We diagnosed 5 children with SOM (Type B) and 1 child with unilateral profound hearing loss.

We are exterey happy with the equipment and want to thank you very much once more for letting us use the Sentiero for this voluntary mission.

Aysen Erdil“

Images taken by team of Dr. Aysen.

Figure 1: Feel the difference: In a cooperative way, the child does MAGIC - the image based audiometry.

Figure 2: See the difference: Diagnostic OAE is performed in a classroom. Using the PELTOR device together with our sound probes, an additional sound insulation of 20 dB can be achieved.
